Executive Summary

SINOCLIMA, a Chinese manufacturer with 20 years of experience in parking air conditioners, electric air conditioning, and transport refrigeration, supplied a complete DC parking cooler lineup (E-2200K, E-2400K, E-3200K, SC-2000K) to a North American fleet distributor serving the United States and Canada.

> A 20-truck pilot expanded into a rolling annual reorder program. By replacing overnight idling with engine-off DC cooling, fleets typically avoid burning 1,600–2,000 gallons of diesel per truck per year, stay clear of anti-idling fines, and give drivers the quiet, comfortable rest they need — with low battery cut-off protection eliminating the most common service complaint.

When a truck stops for the night, the engine should stop too. That is the idea behind anti-idling regulations now enforced across many U.S. states and Canadian provinces — and it is also why demand for DC-powered parking air conditioners ("truck bunk coolers") keeps growing in North America.

This case study looks at how SINOCLIMA, a Chinese manufacturer with 20 years of experience in parking air conditioners, electric air conditioning, and transport refrigeration equipment, helped a North American distributor bring a complete DC parking cooler program to fleet customers in the United States and Canada.

1. Project at a Glance

Table 1. Project overview

Item	Details
Customer	A truck accessories and fleet retrofit distributor serving customers in Canada and the U.S. Midwest
Market	United States and Canada
Application	Sleeper-cab and day-cab cooling for long-haul trucks, vans, and RVs
Products Supplied	SINOCLIMA E-2200K, E-2400K, E-3200K rooftop units and SC-2000K split-type unit
Key Requirement	Engine-off cooling, wide-voltage compatibility, low noise, easy installation

Item	Details
Outcome	A pilot fleet of 20 trucks expanded into a rolling annual reorder program

2. The Customer's Challenge: Idling Is Expensive, Noisy, and Increasingly Illegal

The distributor's fleet customers — long-haul trucking companies and owner-operators — faced the same four problems:

1. **Fuel waste.** A diesel engine idling overnight typically burns 0.8–1 gallon (3–4 liters) of fuel per hour. For a driver resting 8 hours a night, 250 nights a year, that can mean 1,600–2,000 gallons of diesel per truck annually — thousands of dollars burned just to keep the cab cool.
2. **Anti-idling rules.** Many jurisdictions in the U.S. and Canada limit unnecessary idling to 3–5 minutes, with fines for violations. Fleets needed a way to keep drivers comfortable without breaking local regulations.
3. **Engine wear.** Idling hours still count as engine hours. Every idling hour is maintenance cost and shortened engine life.
4. **Driver retention.** Drivers who cannot sleep well in a hot cab do not stay long. Cab comfort during rest periods has become a real recruiting issue.

The distributor had tried cheaper generic coolers before. The complaints were familiar: units that drained batteries flat by morning, noise levels that made sleeping difficult, and installation jobs that took a full day per truck.

3. The Solution: A Complete SINOCLIMA DC Parking Cooler Lineup

SINOCLIMA proposed a tiered product lineup, so the distributor could serve different cab sizes, battery configurations, and budgets from one supplier.

3.1 Product Lineup Supplied

Table 2. SINOCLIMA parking air conditioner lineup supplied to the program

Model	Type	Cooling Capacity	Voltage	Weight	Best For
E-2200K	Rooftop, slim integrated	2,200W / 7,600 BTU	DC 12/24/48/72V	19.8 kg	Day cabs and compact sleepers
E-2400K	Rooftop, integrated	2,400W / 8,200 BTU	DC 12/24/48/72V	34.6 kg	Standard sleeper cabs
E-3200K	Rooftop, integrated	1,000–3,200W (adjustable)	DC 24V	40.5 kg	Large sleepers; reading light and voice control
SC-2000K	Split type (rooftop condenser + in-cab evaporator)	2,000W	DC 12/24/48/72V	16.9 kg + 6.5 kg	Trucks where a slim rooftop profile matters

3.2 Why These Units Fit the North American Market

- **Engine-off cooling, all night.** Every unit runs on the truck's DC power with the engine off, so drivers rest in a cool cab without idling — no fines, no wasted fuel.
- **DC inverter scroll compressor.** The scroll compressor technology delivers strong cooling with low vibration, and the inverter control adjusts output instead of cycling on and off. That means steadier temperatures and lower average current draw.
- **Low battery cut-off protection.** The control system monitors battery voltage and shuts the unit down before the batteries are drained, so the truck still starts in the morning. For fleets, this single feature eliminates the most common complaint about cheap coolers.

- **Quiet operation below 65 dB(A).** Both the condenser and evaporator use low-noise fans, quiet enough to sleep next to.
- **Wide voltage compatibility.** DC 12V/24V/48V/72V support across most models means one product family covers pickup-style work trucks, Class 8 tractors, and electric or auxiliary-battery applications.
- **Slim, low-profile rooftop design.** A lower rooftop unit means better fuel economy on the highway and fewer clearance problems at loading docks and drive-throughs.
- **Simple controls for drivers.** A digital panel plus multi-function remote control, with Fan / Eco / Powerful modes. The E-3200K adds a reading light and voice control for hands-free operation at night.
- **One-year warranty.** Backed by a manufacturer that builds the units in its own factory.

4. Implementation: From Pilot Fleet to Repeat Orders

The program rolled out in three stages:

Stage 1 — Pilot (20 trucks). The distributor started with a mixed pilot fleet: regional haulers running E-2400K units, and owner-operators with smaller cabs running E-2200K and SC-2000K split systems. SINOCLIMA provided installation guides and wiring diagrams in English, and each installation took roughly 3–4 hours per truck — about half the time of the split systems the distributor had previously carried.

Stage 2 — Field validation. Over a full summer season, the fleet tracked three numbers: driver complaints, battery-related service calls, and idle-time reduction. Battery cut-offs worked as designed, cooling held up through heat waves above 35°C (95°F), and drivers reported being able to sleep through the night without the compressor noise they remembered from older units.

Stage 3 — Program rollout. Based on the pilot results, the distributor moved the SINOCLIMA line into its regular catalog and set up an annual reorder cycle. SINOCLIMA supports the program with factory-direct pricing, consolidated sea freight to North America, and a spare-parts package so the distributor's service teams can handle maintenance locally.

5. The Results

Table 3. Program results after the first full season (typical estimates)

Metric	Result
Fuel avoided per truck per year	Roughly 1,600–2,000 gallons of diesel (8 h of idling replaced per rest night)
Payback period	Typically within the first one to two years of operation
Installation time	About 3–4 hours per truck
Noise level	Below 65 dB(A) — quiet enough to sleep next to
Warranty	One year, factory-backed

- **Fuel and cost savings.** With idling replaced by DC cooling during overnight rests, fleets typically avoid burning roughly 1,600–2,000 gallons of diesel per truck per year. At North American diesel prices, that puts the payback period for a parking cooler system well inside the first one to two years of operation.
- **Regulatory comfort.** Fleets can rest drivers through mandated rest breaks without idling, keeping them clear of local anti-idling fines.
- **Fewer service headaches.** Low battery cut-off and the factory warranty reduced the battery-related service calls that had plagued the distributor's previous product line.
- **Happier drivers.** Quiet, reliable cab cooling during rest periods has become a selling point the distributor now uses in its own fleet customer presentations.

> *"The reason we stayed with SINOCLIMA is simple: the units do what the catalog says they do, the installations are quick, and when we need parts or answers, the factory responds." — Purchasing manager, the distributing partner (name available on request)*

6. Why Work with SINOCLIMA

SINOCLIMA (Henan Sinoclima Industry Co., Ltd., Zhengzhou, China) is an integrated manufacturer and trading company with 20 years of production and export experience. The company designs and builds:

- **DC parking air conditioners** for trucks, vans, tractors, and RV cabs
- **Electric air conditioning systems** for vehicles and cab retrofits
- **Refrigeration units for refrigerated trucks** (cold-chain transport)

For North American customers, this means one factory-direct source across the cab comfort and cold-chain product range, with export experience covering documentation, packing, and consolidated shipping to the U.S. and Canada. OEM and ODM cooperation is available for distributors and fleet programs.

7. Frequently Asked Questions

Will a parking air conditioner drain my truck's batteries overnight?

SINOCLIMA units include low battery cut-off protection: when battery voltage drops below the set threshold, the system shuts down to preserve starting power. For full-night cooling, many customers add one or two auxiliary batteries or a battery pack sized to their rest routine.

What is the difference between 12V and 24V models?

Heavy trucks in North America commonly use 12V systems; many tractors, buses, and commercial vehicles elsewhere use 24V. Most SINOCLIMA models support DC

12V/24V/48V/72V, so one unit covers multiple vehicle types. The E-3200K is a dedicated 24V model for large sleeper cabs.

How long does installation take?

A typical rooftop unit installation takes about 3–4 hours: mount the rooftop unit, run the wiring to the batteries, and fit the in-cab control panel. The SC-2000K split system separates the condenser and evaporator for trucks that need a slimmer rooftop profile.

How much fuel can I actually save?

A diesel engine at idle typically consumes 0.8–1 gallon per hour. If DC cooling replaces 8 hours of idling per night, the savings are roughly 1,600–2,000 gallons per truck per year — often several thousand U.S. dollars annually at North American fuel prices.

What is the cooling capacity I need for my cab?

As a guide: 2,000–2,400W (7,000–8,200 BTU) suits day cabs and standard sleepers; larger sleeper cabs or hot-region operations should look at the E-3200K with up to 3,200W of adjustable cooling.

What is the warranty?

SINOCLIMA parking air conditioners carry a one-year warranty, with spare-parts packages and technical support available through your distributor or directly from the factory.

Can I order in small quantities first?

Yes. A pilot order for field testing is the recommended way to start, as in this case study. Contact SINOCLIMA for MOQ, lead time, and freight options to the U.S. and Canada.

8. Start Your Own Program

Whether you are a distributor, fleet operator, or vehicle upfitter in the United States

or Canada, SINOCLIMA can support you from pilot testing to full rollout with factory-direct supply and 20 years of export experience.
